

# Muhammed Turhan 28840

## Project Report

### 1. Exporting CSV and Converting to Pandas DataFrame:

- The project begins with a section on exporting data and converting it to a Pandas DataFrame, which is a crucial step for data analysis.

### 2. Data Import:

- This Project gets its data from chosic.com as a CSV file as it was used in our earlier assignment. There are no other tools or applications used for the data importing process.

### 3. CSV to DataFrame:

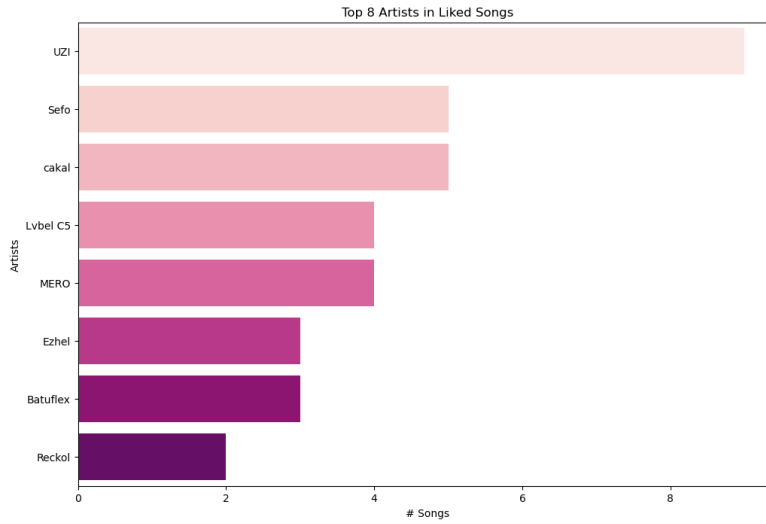

- The data is loaded from a CSV file into a Pandas DataFrame.

### 4. Data Analysis:

- The notebook includes a section titled "Data Analysis," indicating a focus on examining the Spotify data.

### 5. Top 5 Genres & Top Artists:

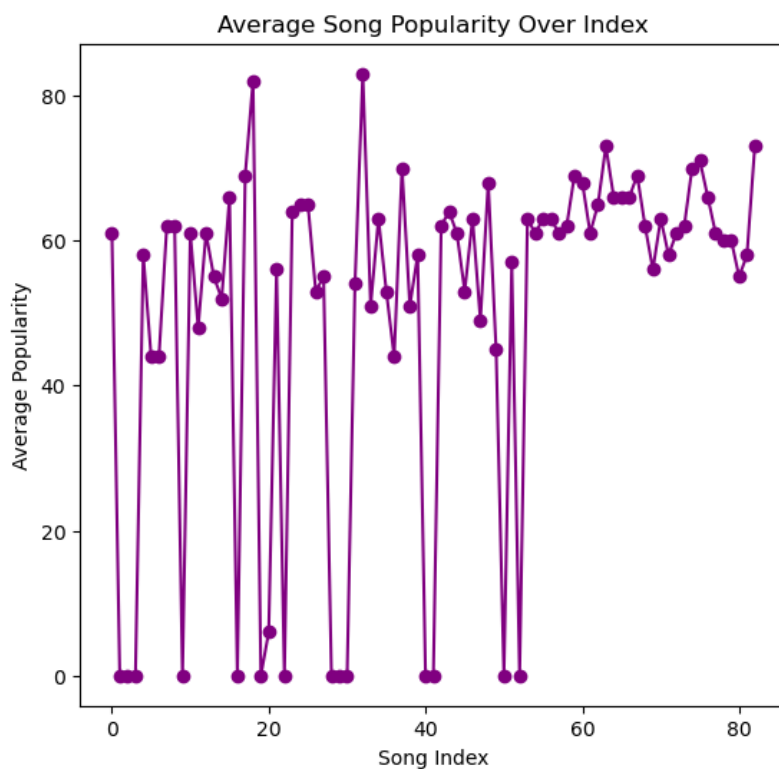

## 6. Genre Distribution over adding time:

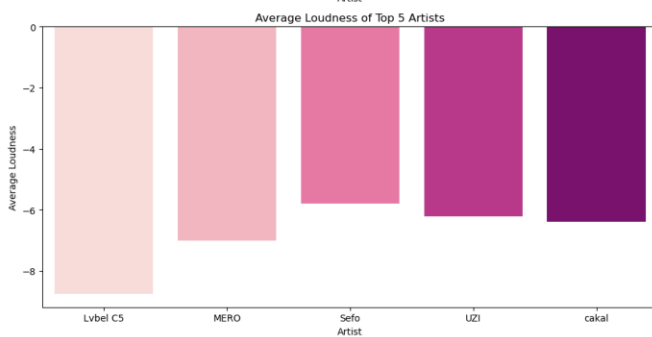

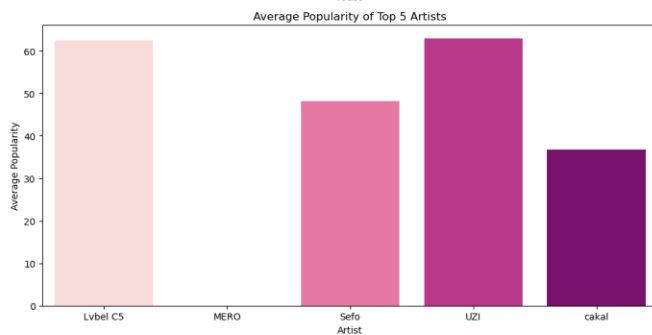

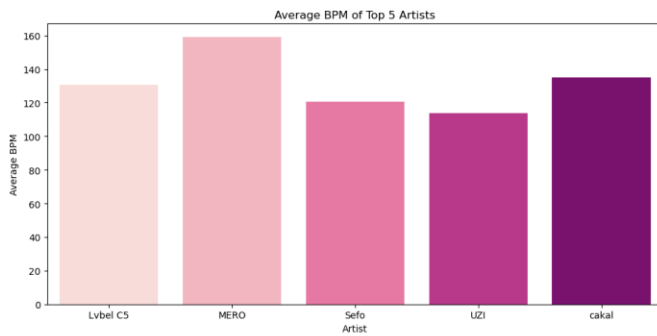

## 7. Average Popularity Over Time:

## 8. Average BPM across genres:

## 9. Looking deeper into BPM-Loudness-Popularity Correlation:

## 10. Implementing Machine Learning in order to create 10 song playlist matching my song taste:

- **First we labelled the data:**

```
df['Top Song'] = df.apply(lambda x: 1 if (115 < x['BPM'] < 155) and  
                           ('Hip Hop' in str(x['Parent Genres']))) else 0, axis=1)
```

- **Then we trained the data with a 30% test size**

```
X_train, X_test, y_train, y_test = train_test_split(X_scaled, y,  
                                                    test_size=0.3, random_state=42)
```

```
X_train.shape, X_test.shape, y_train.shape, y_test.shape
```

- **After training, achieved these scores:**

```
Accuracy: 0.8  
Confusion Matrix:  
[[13  2]  
 [ 3  7]]  
Report:
```

	precision	recall	f1-score	support
0	0.81	0.87	0.84	15
1	0.78	0.70	0.74	10
accuracy			0.80	25
macro avg	0.80	0.78	0.79	25
weighted avg	0.80	0.80	0.80	25

- **Finally, we created our playlist with a 1 false positive result(last of the playlist)**

## As a Final Task - Creating 10 Song Playlist

The playlist includes 1 false positive top song just to match its accuracy, it is the last one :)

```
test_indices = X_test.index

true_positives = test_indices[(y_pred == 1) & (y_test == 1)]
false_positives = test_indices[(y_pred == 1) & (y_test == 0)]

selected_songs_indices = true_positives.tolist() + false_positives[:1].tolist()

playlist = df.loc[selected_songs_indices, ['Song', 'Artist', 'BPM', 'Primary Genre']]

playlist
```

	Song	Artist	BPM	Primary Genre
30	GECELERIN DERDİ	BEGE	125	turkce drill
0	Dünya Hain	Batuflex	145	turkish hip hop
12	Hayrola	Artz,Bugy,Ezhel	151	turkish hip hop
49	Hayrane	Reo Manchs	140	new school turkce rap
70	illegale	Batuflex	138	turkish hip hop
67	TALIBANA	DEHA INC.,Rekol	123	new school turkce rap
56	Sarı Bana	Velet,Dilan	129	turkish hip hop
69	Perros Blancos	Rekol,cakal	140	turkce drill
